Approval of the Carmichael Mine – An Australian failure to understand and apply groundwater science

As an expert witness called by a conservation group to assist the Court, I had the privilege of observing the legal battleground of the Queensland Land Court in action in 2015. I held high expectations and optimism that my knowledge would provide useful service to the court. **The decision to approve the mine is underpinned by misconceptions and considerable uncertainty on the back of a deplorable lack of field measurements.**

A critical issue within the case was whether excavating one of the world's largest coal mines in close proximity to a nationally important wetland, fed by groundwater, would threaten the extinction of the associated Doongmabulla Springs and the endemic species that rely on them.

Why is data important?

- Data as an information business asset;
- Understanding your (unique) environment;
- Facilitate better decision making;
- Risk mitigation;
- Measurable improvements in compliance;
- **It is difficult to gather when you really need it!**

Our technology has improved to the point where I can now receive crap at the speed of light

CEO, Health, USA

How is data used?

- Baseline condition;
- Identifying existing contamination sources impacting project sites;
- Forecasting potential impacts of development as part of the environmental impact assessment process;
- Asset management;
- Test mitigation measures / treatment efficacy;
- Ensure accountability and transparency for industry to regulatory standards;
- Drive sustainable design criteria for new developments; and
- Structured problem solving processes.

Poor approaches to designing a monitoring program

- What have we done before?
- What equipment have we already got?
- Inappropriate resourcing - junior resource / non-skilled?
- Can we out-source?
- What sites can we get easy access to?
- Tick-box exercise
- Splendid isolation!

What is a monitoring program?

- Locations;
- Parameters;
- Frequency;
- Duration;
- Collection methods;
- Laboratory analysis;
- Data analysis;
- Data storage, interrogation & retrieval;
- Data reporting; and
- Re-evaluation / adaption.

Sources, pathways & down-gradient EV's

| Monitoring program component | Sources | Pathways | EV's |
|---|---------|----------|------|
| Locations | ✓ | ✓ | ✓ |
| Parameters | ✓ | ✓ | ✓ |
| Frequency | ✓ | ✓ | ✓ |
| Duration | ✓ | ✓ | ✓ |
| Collection methods | ✓ | ✓ | ✓ |
| Laboratory analysis | ✓ | ✓ | ✓ |
| Data analysis | ✓ | ✓ | ✓ |
| Data storage, interrogation & retrieval | ✓ | ✓ | ✓ |
| Data reporting | ✓ | ✓ | ✓ |

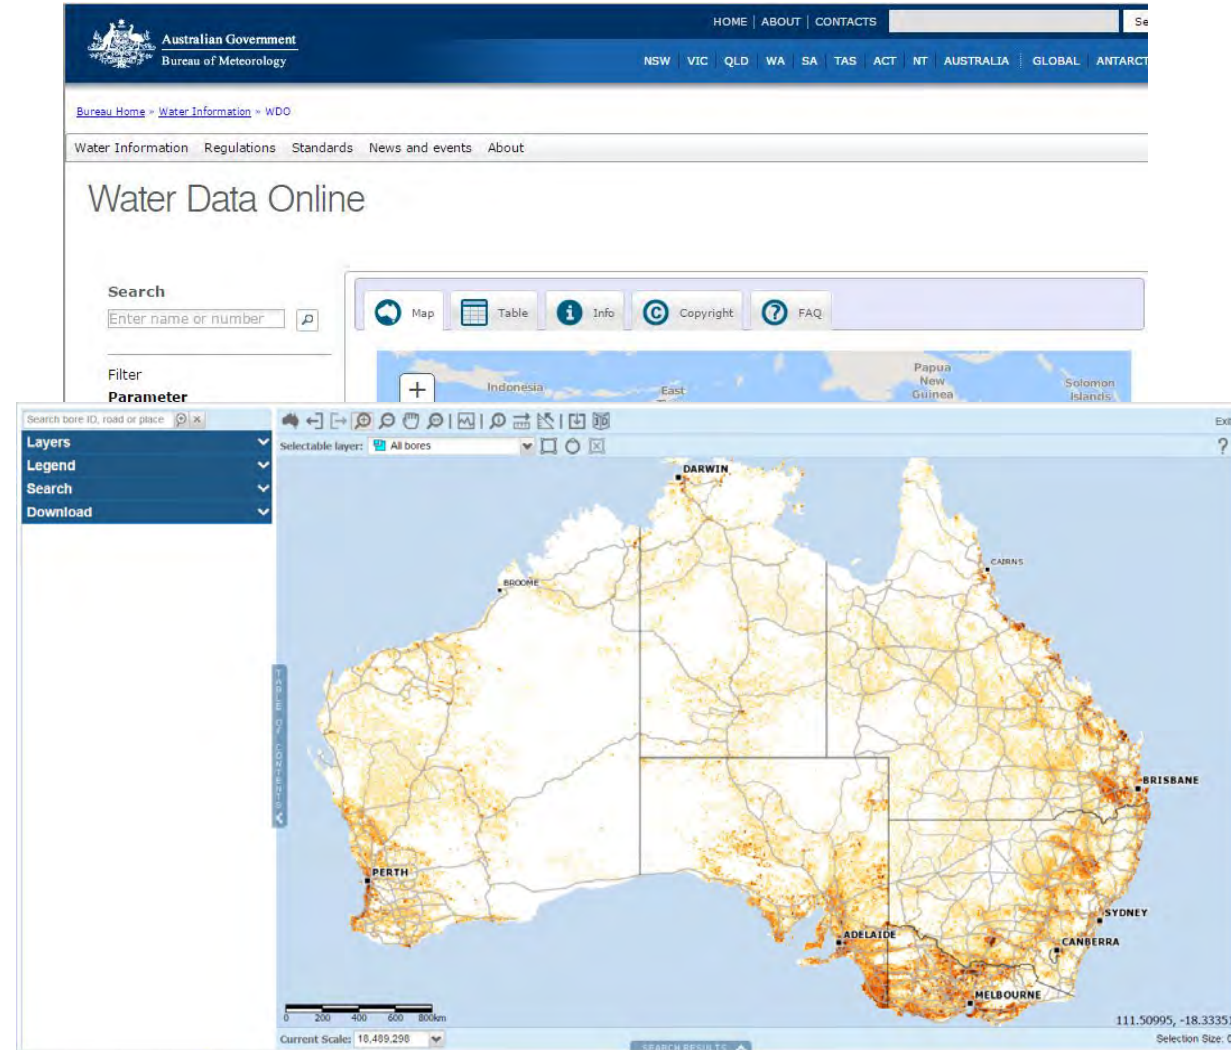

How is a scheme likely to affect hydrological / WQ processes?

- Back-to-front
- Consider:
 - Development footprint;
 - Sources, pathways & EV's;
 - Processes (construction & operation);
 - Timeline;
 - Regulatory requirements;
 - Stakeholders expectations; and
 - Budget!!!
- Similar developments

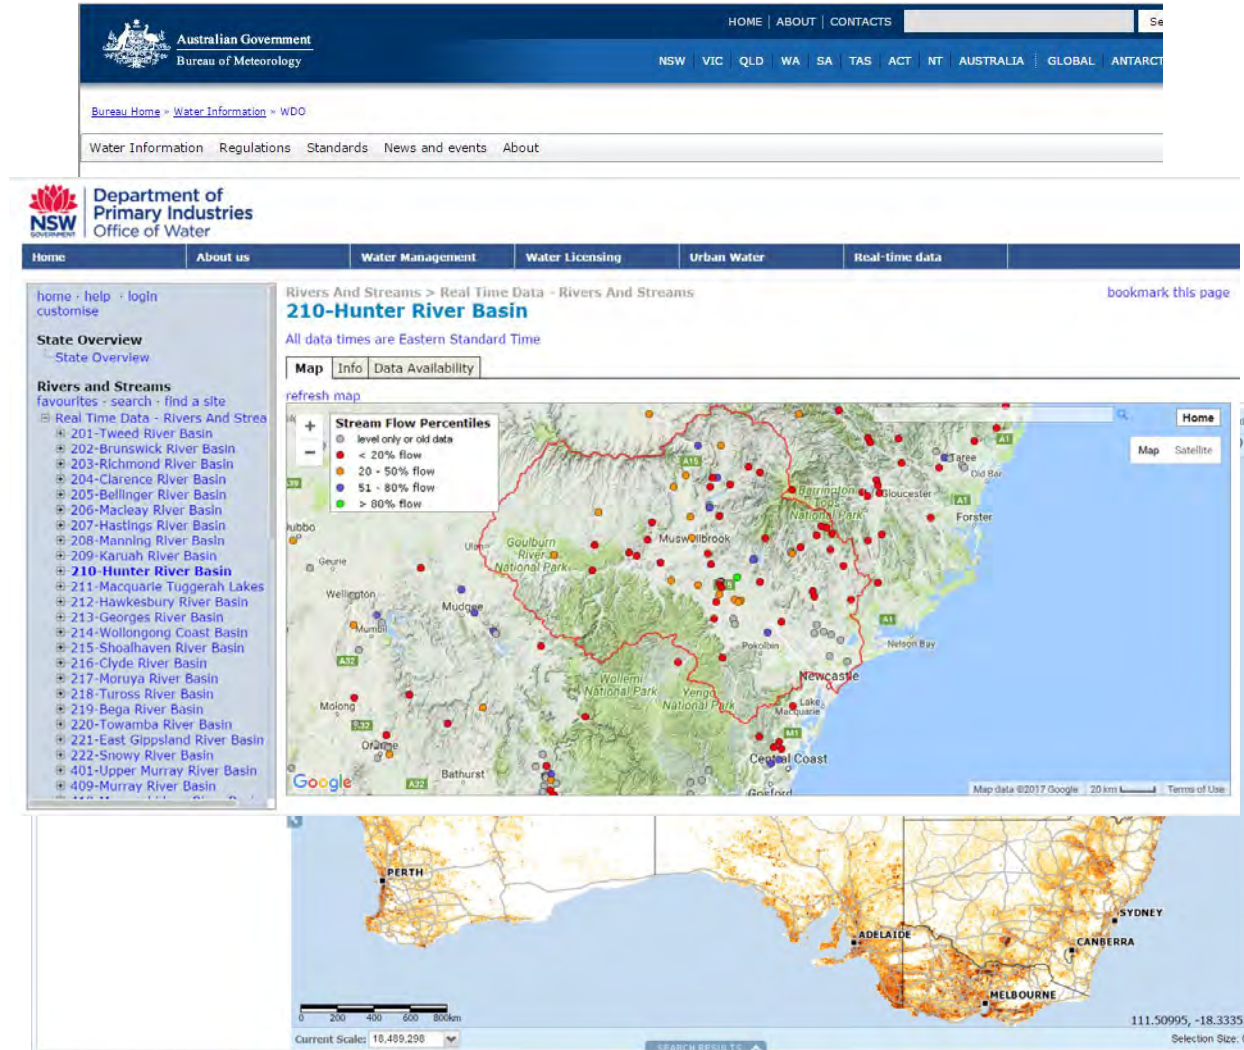

What existing data is available?

- Aerial mapping (e.g. Google Earth, NearMap)
- DBYD
- Site reports (LotSearch)
- Government datasets
 - BoM
 - Community programs (e.g. Streamwatch)
 - Councils
 - State regulators
 - Water utilities

Sample integrity

- Filtration (on-site versus lab);
- Storage (dark / cool);
- Appropriate material for sample bottles (LDPE, HDPE, glass, amber); and
- QA / QC procedures (trip blank, trip spike, sample blank, duplicates).

Dr. DJ Evans, Atkins

Assessing Sampling and Analysis Techniques

Implications for calculating nutrient and sediment loads

Do water samples collected routinely for monitoring programmes accurately reflect river phosphorus (P) and suspended solids (SS) concentrations? This paper examines several stages of standard sampling, preservation and analysis techniques (SSPAT) for water samples from two lowland UK rivers. Although universal analytical procedures are necessary for data comparison, this paper indicates that adopting a SSPAT approach alone may jeopardise sample representativeness. Therefore, preliminary surveys to assess whether SSPAT protocol is sufficient to quantify P and SS loads are highly recommended.

Introduction

To assess nutrient and sediment mobility within rivers, P fractions and SS concentrations are normally determined on samples collected from the water column¹. Recommendations for sampling frequency¹ and shortfalls in the laboratory analysis of P³ are well documented in the literature. However, there are several stages of SSPAT that need more consideration before initialising a P and SS monitoring programme. Loads are derived from the product of concentration and discharge over a specified time increment. However, whilst determining discharge does not normally present any practical problems obtaining representative concentration data is more problematic. Nutrient and

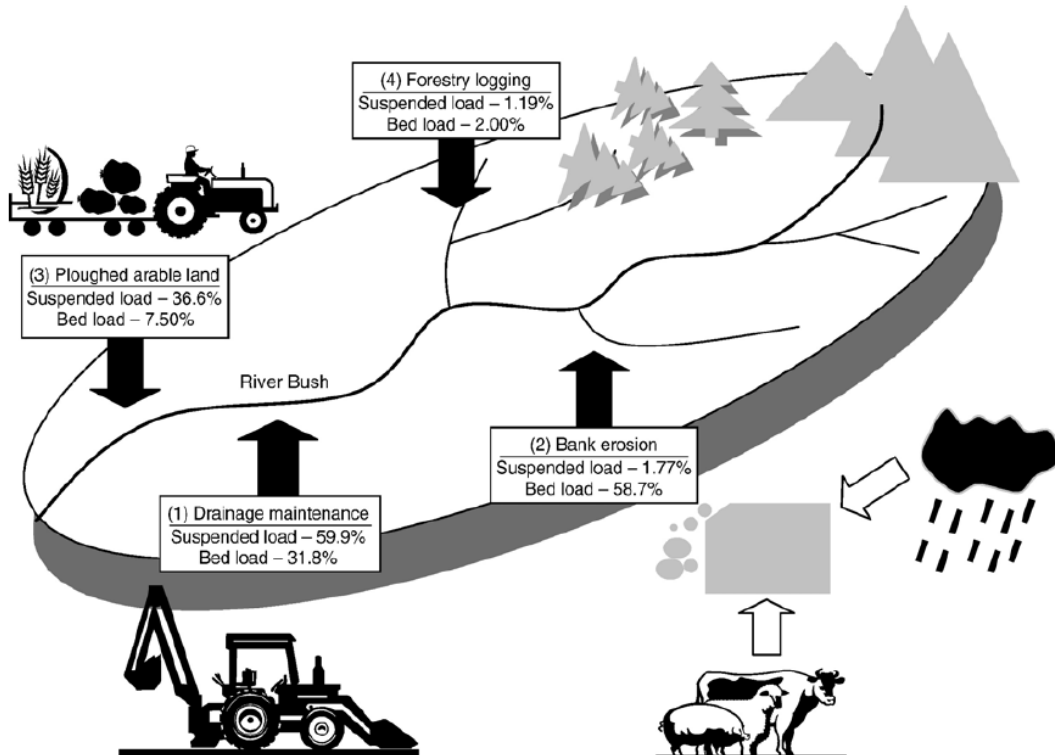

sediment loads in river basins are under increased scrutiny in the EU community because the deadline for meeting Water Framework Directive objectives will be implemented in 2015. A crucial question is: do water samples collected routinely in P and SS monitoring programmes accurately reflect actual concentrations in the river? If not, what degree of uncertainty does this generate in loads estimated from these programmes? This paper addresses some of the limitations involved in adopting SSPAT protocol in terms of assessing P and SS mobility within two lowland UK catchments.

Sample sites

The Rivers Lambourn and Enborne are tributaries of the River Kennet, England (Figure 1). The Lambourn lies on Chalk and has a fast flowing, shallow channel with extensive water crowfoot beds (*Ranunculus pericollatus* var. *calcareus*). The regime of the Lambourn is subdued with hydrographs dominated by delayed throughflow and maximum flow in March. The Enborne drains impermeable Tertiary sand, silt and clay deposits. The river has a slow flowing, deep channel with limited submergent macrophytes. The regime of the Enborne is flashy, with maximum monthly flows in December/January, coinciding with maximum precipitation, and hydrographs are dominated by quickflow response.

Laboratory advances

Data storage and interrogation

- Data for data's sake?
- Make data work for you;
- Asset loss;
- In-house Excel conditional formatting;
- MS Access;
- Commercial data management software;
- GSM / Bluetooth data transfer; and
- The 'Internet of Things' - interconnection via the Internet of computing devices enabling data send and receive data.

The collage consists of three main components:

- News Website Snippet:** A screenshot of a news article from 'news local' with the headline '45% of bottle shop staff didn't c...'. It features a photo of a person holding a water bottle near a body of water.
- Water Quality Dashboard:** A screenshot of a 'Water quality' monitoring dashboard. It includes a navigation menu (Home, Economics, Monitoring results, Water quality, Water quality graphs), a list of project milestones (e.g., 'MIC's concept approval', 'SMTA's project approval'), and a bar chart showing 'Water quality' data over time. The chart has two series: 'Actual' (green bars) and 'Target' (blue line).
- Excel Spreadsheet:** A screenshot of an Excel spreadsheet with conditional formatting. The columns include 'Reactive Phosphorus', 'Electrical Conductivity', and 'pH Unit'. The 'Reactive Phosphorus' column has values ranging from 0.1 to 7.2, with cells colored in a gradient from green to red. The 'Electrical Conductivity' column has values ranging from 207 to 350.

At the bottom of the collage, there is a news article snippet titled 'Catchme uses Blu... quality o...' with the byline 'Therese Murray, Central Coast Gosford Express Advocate' and the date 'September 13, 2016 10:06am'.
